EDUCATION

•Banasthali Vidyapith, Rajasthan

2024 to 2028

Bachelor of Technology in Electronics and Communication Engineering

CGPA (up to 4th semester): 8.26

•DAV Public School, Kusunda

2022

Central Board of Secondary Education (CBSE), Class XII

Class XII: 80.33%

•DAV Public School, Kusunda

2020

Central Board of Secondary Education (CBSE), Class X

Class X: 86.80%

TECHNICAL SKILLS AND INTERESTS

Languages: Python, C++, Java, SQL, Bash

Machine Learning: PyTorch, TensorFlow, scikit-learn, OpenCV, Hugging Face Transformers, model training and fine tuning, evaluation and error analysis

Agentic AI: Claude Code and similar agentic coding assistants, Model Context Protocol (MCP), tool calling, prompt and context design, multi step agent workflows

Backend and Data: FastAPI, REST API design, Streamlit, Pandas, NumPy, MySQL, SQLite

MLOps and Tooling: Git, GitHub, Linux, model serving and versioning, latency profiling, logging and monitoring, Postman, VS Code

Core Coursework: Data Structures & Algorithms (DSA), Object Oriented Programming (OOP), DBMS, Operating Systems, Computer Networks, Probability and Statistics

Interests: Applied machine learning, agent based systems, low latency backend engineering, quantitative problem solving

MACHINE LEARNING AND SOFTWARE PROJECTS

•AI Powered Recruitment Ranking Platform

Personal Project

Python backend that parses resumes, scores candidates against a role, and serves results to recruiters.

- Wrote the parsing and feature pipeline in Python: text extraction, cleaning, normalisation and skill tagging, with parsed output and scores stored in SQLite so runs could be compared later.
- Built the candidate scoring layer on top of scikit-learn, and checked it against a hand labelled sample set to see where the ranking was going wrong before tuning the features.
- Exposed scoring through REST endpoints and wired them to a Streamlit dashboard, so a recruiter could re rank a batch and inspect why a candidate scored the way they did.

•ChatShield: Low Latency Multilingual Moderation API

Hack Celestia / 2026

FastAPI service that serves NLP models to flag toxic messages in English, Hindi and Hinglish.

- Served transformer based classifiers behind FastAPI, loading models once at startup and batching requests so the service stayed usable under load instead of paying model load cost per call.
- Added a severity level on top of the binary flag so borderline messages could be handled differently from clearly abusive ones, and logged predictions for later review of false positives.
- Kept the service stateless and configuration driven so it could be dropped into an existing chat app without touching the app code.

ACHIEVEMENTS

•Hack with Rajasthan, 3rd Position

2025

- Owned the data pipeline and model integration for an OSINT intelligence tool, reaching **95% processing accuracy** and cutting manual verification effort by roughly **70%**. Placed third against **250+ teams**.

•GenIgnite at Microsoft, Top 15 Finalist

2025

- Trained and deployed a safety equipment detection model for industrial camera feeds, holding **92% accuracy** at under **200ms** per frame on the serving setup, which was the constraint that mattered for live monitoring.

•Hack Celestia, Project Finalist

2026

- Built **ChatShield** with a small team and handled the API layer and model serving side of the multilingual moderation system.

•Problem Solving and Coding

2024 to Present

- Solved **350+ problems** on LeetCode in C++ and Python, mostly graphs, dynamic programming and array based optimisation, along with corporate assessments on HackerRank.
